

In the Specification

Please replace paragraph [024] with:

[024] Figure 3 shows a display with a projector as an element of the display system. Although video projectors are typically used for rendering images on a planar display surface, it is also possible to project images onto three-dimensional structural elements such as shelves, walls, signage 311, and products 312. Multiple projectors can be used to increase the size of the displayed images. The images can be warped and blended so as to appear seamless on curved surfaces. The appearance of high-resolution monitors can be simulated to provide detailed product information. Projected images can highlight product features, and visually show options such as color and texture.
